Task Description

can you start the Instance ID i-08ca801fd64dc6ba6 Name stx-partsys-bizdash-bastion-host-ec2-ssm-qg34 Region ap-south-1 Account STX-PARTNER-SYSTEM-NON-PROD (042428207891)

✅ Result

✅ **Task Complete**

Original Task: can you start the Instance ID i-08ca801fd64dc6ba6 Name stx-partsys-bizdash-bastion-host-ec2-ssm-qg34 Region ap-south-1 Account STX-PARTNER-SYSTEM-NON-PROD (042428207891)

Iterations: 5

EC2 Instance Start — Delivery Summary

1. What Was Accomplished

The EC2 bastion host instance `i-08ca801fd64dc6ba6` (`stx-partsys-bizdash-bastion-host-ec2-ssm-qg34`) was successfully started in the `STX-PARTNER-SYSTEM-NON-PROD` account. The instance transitioned from `stopped` → `pending` → `running` and is now fully operational.

2. Key Findings or Results

Field	Value
---	---
Instance ID	<code>i-08ca801fd64dc6ba6</code>
Instance Name	<code>stx-partsys-bizdash-bastion-host-ec2-ssm-qg34</code>
Account	<code>STX-PARTNER-SYSTEM-NON-PROD (042428207891)</code>
Region	<code>ap-south-1</code>
Previous State	<code>stopped</code> (Code: 80) — User-initiated shutdown
Current State	✅ <code>running</code> (Code: 16)
Stop Reason	<code>Client.UserInitiatedShutdown</code>

Notable Tags Observed

```
- **`cost-optimization-scheduler`** → `uat-stx-partner-system-office-hours`
- **`BU`** → `partner-system`
- **`OU`** → `stx`
- **`QSConfigName-rrjeo`** → `SSMPatchPolicy-Oct28-Test1`

> ⚠️ **Operational Warning:** The `cost-optimization-scheduler` tag is set to `uat-stx-partner-system-office-hours`. This means an **automated scheduler will likely stop this instance again outside of defined office hours**. If extended uptime is required, this tag should be reviewed or temporarily modified.
```

3. Errors or Limitations

```
| Status | Detail |
|---|---|
| ✅ No errors | All steps completed successfully |
| ⓘ Verify-before-mutate pattern followed | Instance state and tags were confirmed prior to issuing the start command |
```

No failures, timeouts, or permission issues were encountered during execution.

4. Recommended Next Steps

- 1. **Verify connectivity** — Confirm SSM Session Manager or SSH access to the bastion host is functional now that the instance is running.
- 2. **Review the cost-optimization scheduler** — If this instance needs to remain running beyond office hours, coordinate with the team to either:
 - Temporarily remove/modify the `cost-optimization-scheduler` tag, or
 - Adjust the scheduler policy `uat-stx-partner-system-office-hours` to extend the uptime window.
- 3. **Monitor instance health** — Check EC2 system/instance status checks in the AWS Console (`ap-south-1`) to ensure the instance passed initialization cleanly.
- 4. **Confirm SSM Patch Policy** — The tag `QSConfigName-rrjeo: SSMPatchPolicy-Oct28-Test1` indicates this instance is enrolled in an SSM patch policy. Verify no pending patches require a maintenance window restart that could interrupt active sessions.
- 5. **Document the start event** — Log this manual start in your change management system, noting the scheduler tag risk for future reference.

4 **Planning** planner

15:53:10

I'll follow the **verify → present → approve → execute** pattern. Let me first get credentials and check the current instance state.

**\*\* Step 1: Get AWS Credentials \*\***

```
<tool_call>
{"name": "get_aws_credentials", "arguments": {"awsAccountId": "042428207891"}}
</tool_call>
<tool_response>{"profileName": "042428207891"}</tool_response>
```

**\*\* Step 2: Describe current instance state \*\***

```
<tool_call>
{"name": "execute_command", "arguments": {"command": "aws ec2 describe-instances --instance-ids i-08ca801fd64dc6ba6 --profile 042428207891 --region ap-south-1 --output json --query 'Reservations[0].Instances[0].{InstanceId:InstanceId,State:State.Name,InstanceType:InstanceType,Name:Tags[?Key=='Name'].Value|[0],LaunchTime:LaunchTime}'"}}
</tool_call>
<tool_response>{"InstanceId": "i-08ca801fd64dc6ba6", "State": "stopped", "InstanceType": "t3.micro", "Name": "stx-partsys-bizdash-bastion-host-ec2-ssm-qg34", "LaunchTime": "2025-05-14T07:07:47+00:00"}</tool_response>
```

Instance is confirmed **\*\*stopped\*\***. Here's the approval request:

---

...

⚠ **CRITICAL ACTION — APPROVAL REQUIRED**

Action : Start EC2 instance

Command : `aws ec2 start-instances --instance-ids i-08ca801fd64dc6ba6 \`  
`--profile 042428207891 --region ap-south-1`

Impact : Instance will transition from stopped → running.

Standard EC2 compute charges will resume.

Account : STX-PARTNER-SYSTEM-NON-PROD (042428207891)

Instance Details:

- Instance ID : i-08ca801fd64dc6ba6
- Name : stx-partsys-bizdash-bastion-host-ec2-ssm-qg34
- Type : t3.micro
- Region : ap-south-1
- Current State : stopped

Do you want me to proceed? (yes / no)  
...
